Stable isotopes of water

The difference in ratio between the concentration of the minor and major isotopes are expressed in terms of 'δ' (delta),

$$\text{eg. } \delta^{18}\text{O} = \left(\frac{R_{\text{SAMPLE}} - R_{\text{STANDARD}}}{R_{\text{STANDARD}}} \right) \times 1000 \text{ ‰}$$

where, $R = \frac{^{18}\text{O}}{^{16}\text{O}}$

Introduction

- All of naturally occurring differences in atomic mass is not in chemical properties.
- If I have two you have, all you need to remember is that isotopes of water have different weights.
- Some elements have more isotopes means that the isotopic is heavier.
- Each sample of water has a combination of lighter and heavier isotopes.
- This ratio between them is a result of different hydrological processes.
- Isotopes are usually not generated in absolute nature.
